Series 481:

Dimensioning by pressure loss on the outlet pressure side

Flow chart water

Dimensioning by flow velocity

For Liquids

With \hat{N} help of the chart you can determine the nominal diameter (DN) for a given flow volume V (\hat{m}^3 /h). According to DVGW-guidelines (DIN 1988) a flow velocity of 2 m/s in domestic water supply systems should not be exceeded.

For compressed air and other gaseous media:

The usual flow velocity for compressed air is 10 - 20 m/s. For gaseous media the flow volume V should always be shown in actual cubic meters/hour. If the flow volume is given in standard cubic meters, these should be converted into actual cubic meters before using the diagram.

$$V\left(m^{3}/h\right) = \frac{V_{\text{Norm}}\left(Nm^{3}/h\right)}{p_{\text{absolut}}\left(bar\right)} = \frac{V_{\text{Norm}}}{p_{\ddot{\upsilon}} + 1}$$

Actual cubic meters are based on the prevailing pressure of the medium on the outlet side of the pressure reducer.
